Unique “Walking Therapy” to Stop Covid Clots

Dr. Darrell DeMello uses Ivermectin to stop Covid virus replication, allowing the body to kill the original virus. He uses the anti-inflammatory drug Colchicine, which he calls his “fire retardant,” to reduce body inflammation. Plavix is also given to stop the huge platelet bounce-back that causes clotting, especially for the obese and diabetic.

Dr. DeMello says, if treatment doesn't begin until day 8, the patient is in big trouble. For people who come to him late in the disease, he has them walk all night long for the first day to break up the clotting process. After that, patients must wake up every three hours to walk for an hour until the clotting danger is over. They must only lay prone during the day, never on their backs. Only 14 of his 6,000 patients have died.
