DENMARK: “The Decision to Vaccinate Children Was a Mistake”

The FDA has approved Covid shots for children as young as six months. Seventy-six physicians asked Great Britain’s health authorities not to follow suit. Their concerns include:

- Vaccine efficacy was only 25 percent
- The results were based only on 10 children
- The manufacturer said the numbers were too low to draw any confident conclusion; and
- To evaluate safety, the children were only followed for two months

The doctors said, it’s “incomprehensible that the FDA considered that this represents sufficient evidence on which to base a decision to vaccinate healthy children.” Furthermore, they wrote that Danish health authorities have said “that with what is now known, the decision to vaccinate children was a mistake.”

Presented daily by Twila Brase, President and Co-founder Citizens’ Council for Health Freedom.
