It’s True. Covid Shots Affect Menstruation

The New York Times is reporting on a recent study by researchers at two universities. The study confirms the claims of that the Covid shot causes changes in women’s menstrual cycles.

Women with regular periods indeed had heavier bleeding, and an amazing 66 percent of post-menopausal women experienced unusual bleeding. In the early days of the shots, women with these complaints were dismissed.

Menstruation is an inflammatory and hemorrhagic event. The bleeding must be stopped by coagulation. The researchers think the vaccines may have disrupted this clotting process. Given that the Covid spike protein, which is generated by the jab, causes inflammation and clotting issues, the researchers may be correct.
