Do Covid Shots Lead to Microscopic Clots?

Dr. Charles Hoffe, a Canadian physician who’s given about 900 doses of Moderna suggested a patient who’d already had Covid did not need a second shot. Word got back to the hospital administration and he was fired. But now, given the disabilities in some of his patients after vaccination, he is concerned about what the Covid spike protein created by the shot is doing in the bodies of the vaccinated.

He’s found blood clots at the capillary level—microscopic clots. Using the D-dimer test, 62 percent of his patients were positive for clotting after vaccination. These tiny clots don’t show up on CT or MRI scans, but the symptoms can be severe. Some of his once-healthy patients now have permanent lung damage.
