Did CDC Commit Malfeasance?

The CDC claimed their own public Vaccine Adverse Events Reporting System wasn't trustworthy. So they created the not-public v-safe database where they tracked more than 10 million recipients of the Covid shot.

But in May 2023, the CDC shut down that database. A former leader at the FDA says discontinuing the long-term safety monitoring of the Covid shot was a bad decision because mRNA technology is new, and the long-term consequences are unknown.

With the Biden administration pushing yet another booster, did the CDC shut down the v-safe database so they could not see long-term vaccine injuries or be responsible for failing to address them? Until proven otherwise, this is malfeasance.
