**New Ivermectin Study is Great News**

Regular use of ivermectin reduces the risk of dying from Covid by 92 percent. More than 88,000 people in Brazil were evaluated for this new peer-reviewed study. Hospitalization for regular users of ivermectin was 100 percent lower than irregular or non-users. Notably, those who were irregular users still had a 37 percent lower death rate than those who never took ivermectin.

Regular users are those who take more than 30 tablets of ivermectin over five months. Typically, every 15 days, they use two to three tablets for two days in a row. Those who did not use ivermectin had a seven-fold increase in death compared to regular users.
