Is This Why Fauci Said COVID-19 Vaccine May Backfire?

Dr. Tony Fauci told the U.S. Senate that a COVID-19 vaccine may backfire. The disease could become more virulent in the vaccinated.

Eight years ago, his department funded coronavirus vaccine research. The vaccine caused lung damage in the mice. This reminded the researchers of the trial of a different childhood vaccine. When the children later got infected with the real virus, 80 percent were hospitalized and two died.

The researchers were worried about human trials. Other animals vaccinated with coronavirus also experienced more severe disease when later infected. Is this why Dr. Fauci said the vaccine may backfire? If so, why all the hype and no shouting from the roof-tops about the dangers?
