# Health Freedom Minute

September 15, 2020

## **ALERT - 90% of Positive COVID Tests Likely Negative!**

Most positive Covid-19 tests are not actually positive. The nose-based PCR tests, have been done wrong, reports *The New York Times*. If you have an infectious viral load, the lab should find it by cycling through the nasal matter 15 to 22 times. But labs are doing 37 to 40 cycles, catching meaningless matter in the process.

In a study of tests from three states, up to 90 percent of the people testing positive carried barely any virus, and could not infect anyone. In fact, 85 to 90 percent of people who tested positive would have been deemed negative using only 30 cycles. So only 10 percent of the people who have tested positive are likely actually positive. Think about that when you hear the number of “confirmed cases.”

**“Your Coronavirus Test Is Positive. Maybe It Shouldn’t Be.”** Apoorva Mandavilli, *The New York Times*, Published August 29, 2020; Updated September 8, 2020: <https://nyti.ms/3mtCbjN>

Presented daily by Twila Brase, President, Citizens' Council for Health Freedom.

*The Health Freedom Minute is now heard in 47 states:  
Mornings M-Th at AM1280 (The Patriot) in MN and 91.5 AM WHKC (FreedomFM) in OH,  
afternoons on American Family Radio, and daily on the CSN network  
and Bott Radio Network.*
