Should We Fear Aerosolized COVID-19?

An October 5 study called “Aerosol Transmission of SARS-CoV-2,” says the aerosolized version of the virus “can remain suspended in air for many seconds to hours” and it can be “inhaled.” They encourage a continuation of restrictions, better ventilation, and more outside activities.

Meanwhile, the epidemiology and public health experts that signed the Great Barrington Declaration support a return to regular life for those at minimal risk. But this study spreads fear and acts as though we can stop the virus.

Seasonal flu is also spread by aerosol transmission, causing many deaths every year. The H1N1 flu virus that caused deaths during the 2009 pandemic is still with us, but we’re immune so we ignore it. Likewise, someday we’ll also be immune to COVID-19.
