## **Will COVID-19 Lead to Injectable Biosensors?**

The U.S. Department of Defense is working on a biochip that could destroy personal freedom.

This chip, the size of a grain of rice, could soon win FDA approval. Built by Profusa, a Silicon Valley company, and partially funded by the Gates Foundation, the chip could be implanted in humans and deliver ongoing feedback on body chemistry and other biometrics. It would permanently tie humans to the Internet.

Profusa says the chip could detect COVID-19 in the general population before symptoms show. This is a prime example of how COVID-19 is being used to expand control over citizen lives and why Americans must not let Big Tech and Big Government end our personal freedom or eliminate the privacy rights that protect freedom. State laws should require fully informed consent and the right to shut it down and remove it.
