Will Paraplegics Walk Again?

Can paraplegics regain the ability to walk? An exciting new study found people with spinal cord injuries can regain some voluntary movement in their legs and feet despite years of having none. The researchers used electrical stimulation and intensive physical therapy. Three men were able to wiggle their toes and flex their legs and even stand independently for a few moments at a time.

Some say much more research is needed to see if the benefits last, but the Wall Street Journal discussed a man who after years of immobility was able to move his legs within a week of having the stimulator turned on. Stay tuned. The impossible may be possible in years to come.
