New App to Report Vaccine Refusniks

You’ve heard the phrase, “There’s an app for that.” Well, there’s a new phone app called “Vaccine Refused.” It allows doctors to share data about all vaccine refusals and to see a map of locations of refusal of various vaccines. Data shared includes locations, patient demographics, vaccines refused and the reason for refusal.

The project is funded by an infectious disease network, which is contracted with the U.S. Centers for Disease Control. In short, this creates a national data system of all those who refuse to be injected according to government vaccination requirements. The University of Iowa claims the data is secure and anonymous. Who thinks that’s true?
