Let Cancer Patients Choose Ivermectin

A new statement by a cancer group says ivermectin and fenbendazole should not be used to treat cancer except in a clinical trial. It claims the potential for toxicity and harmful drug interactions presents an unacceptable risk to patients.

The continued war against ivermectin makes no sense. Stories of people who've been helped by these drugs continue to emerge.

Why try to kill off a drug that could save lives? Cancer patients often die from chemotherapy which targets not only rapidly-dividing cancer cells but other rapidly-dividing cells. Let cancer patients determine their own risk tolerance. They need every tool at their disposal to save their lives, including these inexpensive and safe drugs. Patients need to choose what they want to use. End the war on ivermectin.

“Oncologists Urged to Take Proactive Approach When Discussing Ivermectin, Fenbendazole,” American Society of Clinical Oncology, June 17, 2026: <https://www.asco.org/news-initiatives/policy-news-analysis/oncologists-urged-proactive-approach-discussing-ivermectin-fenbendazole>
